REVISION NEED AND CURRICULUM PROFILE

Revision of a curriculum according to need of the time is an essential exercise. It is to weed out the irrelevant and to add afresh timely relevant matter in systematic and cohesive manner. The existing curriculum for Three Year Diploma In Textile Technology was in much need of revision since long. Accordingly task has been set on to bring it out in the present form. In the process consideration has been given to topics such as Computer Awareness, Environment Pollution, Entrepreneurship which have caught our considerable attention. Accordingly two new papers viz. Introduction To Computer, Industrial Safety have been introduced in the second year of the curriculum. Emphasis on entrepreneurship has been given in the paper Industrial Management and Entrepreneurship Development in the final year of the course. Maintaining the relevant and deleting the less important in the present context a balance has been sought by adding new ideas as and where wanted. This has been done by thorough scrutiny of the old curriculum with the help of experts from industry and institutions. Besides it due care has been taken in rearrangement and distribution of subject matter over three year period of course to make it rationally progressive in class room teaching.

In first year of the course all the papers common to other discipline have already been revised. The last two papers viz. Textile Fibres and Textile Manufacturing Processes have been fully revised by enriching and rationally arranging the matter. Also addition of lab work with Textile Fibres is an extra impetus to students learning. The subject matter of the paper General Mechanical Engineering has been made more relevant to the need of textile industry. Addition of lab work with this paper will still more fortify its effect.

Dependence of industry on electrical power makes it imperative to introduce students with handling of electrical machines and instruments. So a new paper Electrical Technology and Electronics with lab work has been introduced in second year of the course.

In the final year of the course a new paper Advance Spinning and Weaving covers new developments in the field of processing and machinery.

Besides this project work in the final year covers design and development of product, setting up of small unit to encourage entrepreneurship and also rural development, environment pollution to be friendly to nature and society. With all this it is hoped that this new curriculum will rise up to horizon of the expectations of industry.

Rationale

Drawing, which is known as the language of engineers, is a widely used means of communication among the designers, engineers, technicians, draftmen and craftsmen in the industry. The translation of ideas into practice without the use of this graphic language is really beyond imagination. Thus, for the effective and efficient communication among all those involved in an industrial system, it becomes necessary that the perosnnel working in different capacities acquire appropriate skills in the use of this graphic language in varying degrees of proficiency in accordance with their job requirements.

Generally speaking, an engineering technician working at the middle level of the threetier technical manpower spectrum, is required to read and interpret the designs and drawings, providedto him by technologists and subsequently to translate them to the craftsmen for actual execution of the job.

This course in Engineering Drawing has been designed, keeping in view, the above refered job functions of a technician in the industry. This preliminary course aims at building a foundation for the further courses in drawing and other allied subjects. The contents of the course have been selected as to form a core for the various deversified fields of engineering. It is expected that at the end of this session, the students acquires sufficient skill drafting and some ability in spetial visualization of simple objects.

RATIONALE

The requirement of energy has increased manifold in last two decades due to rapid urbanization and growth in industrial/service sector. It has become a challenging task to meet ever increasing energy demands with limited conventional fuels and natural resources. Due to fast depletion of fossil fuels and a tremendous gap between supply and demand of energy, it is essential to adopt energy conservation techniques in almost every field like industries, commercial and residential sectors etc. Energy conservation has attained priority as it is regarded as an additional energy resource. COURSE OUTCOMES

After studying this course, a student will be able to co-relate and apply fundamental key concepts of energy conservation and energy management in industry, commercial and residential areas. A student will be able to:

- Define principles and objectives of energy management and energy audit.
- Understand Energy Conservation Act 2001 and its features.
- Understand various forms & elements of energy.
- Identify electrical and thermal utilities. Understand their basic principle of operation and assess performance of various equipments.
- Identify areas of energy conservation and adopt conservation methods in various systems.
- Evaluate the techno economic feasibility of the energy conservation technique adopted.

INSTRUCTIONAL STRATEGY

Teachers are expected to lay considerable stress on understanding the basic concepts in energy conservation, principles and their applications.
