PROLOGUE TO REVISION

In the ever expanding universe of knowledge, the need for revision of a curriculum in any system of education, always exists. A revision is vital to accommodate new ideas, to systematise them and to make them suitable to need of the time. Material is the sole basis of present day science and technology, and its consumption is spiralling to the extent that there is a crises for many materials in the present age. Besides this, with the advance of science and technology, new uses of the materials are also identified every day. For example ceramic materials about 30 years before, there have been a very limited use but now it is vast field where they find their new uses and ceramic itself is now a separate discipline of knowledge for scholars to study and research. Science and technology has gone to the extent where it is possible to develop the materials of our choice for intended use and this have happened in the field of ceramics too. A new group of materials known as composite material has come up. Ceramics has contributed too much to it and to its uses in the field of advance technological designs of three year diploma curriculum in ceramic Engg. has been felt imperative .

The aims and objects of the curriculum keeping the same as before, the changes required in the present curriculum, to make it suitable to present needs, has been carefully made. Care has been taken in choosing the topics for development of knowledge and skill wanted for jobs available to diploma holders. The continuity and consistency in the development of subject matter spreading over the period of three year span has been carefully assured.

Besides this, issues of present day obsessions of the society such as environment pollution, ecological imbalance and need of development of enterprenurship in the youth due to growing unemployment too has been duly introduced for the awareness of the students.

The present curriculum is the out come of up-shorts of the experts in the work shop organised for the purpose and thoughts obtained by personal contacts. A list of their names appears on the following page sufficient provision for practical experience has been made in the curriculum by providing a good number of labs/shops exposure to industry twice during the period of the course, first after first year exam for 2 weeks and second after second year exam for 4 weeks, will certainly give a extra imptus to sharpening of the students talent.

In addition to this all , the following changes can not remain concealed to any reviewer of the text. They are as envisaged below.

1. For the first time a provision for project work has been made in the final year of the course. It is just to give the students an opportunity to deal a practical problem in the light of the knowledge and skill they attained during the course of their studies. This will also help developing an enterprenurship attitude in them.
2. There is prolific growth of machanisation in every field of work from large industrial to cottage industry. With this

Corrected and Approved By B.T.E. on dated 19.04.2017

view in mind, a concept of machanisation has been introduced for small unit works.

3. A product should have an aesthetic appeal in addition to its functional utility, with this view some concepts regarding aesthetic sense too has been given a due space. A new class of materials called ceramic composites has been given a due place and weightage in the course.
4. In Glass Technology-II paper ornamental glass introduced in place of Sealent Glass.
5. Preperation of Jigger & Profile has been deleted in the Final year.

During revision the subject matter has been carefully arranged according to developmental continuity to help teaching and comrehensiveness. The new ideas where-ever felt necessary have been added to enrich the course study. It is hoped now that the new form of the curriculum will certainly prove conducive to students employment in present enviorance of the industry.

NEED ANALYSIS

The utility of glass and ceramics is wellknown in the present civilisation. It has wide application in domestic, industrial and decorative utility articles. By now the personnel involved in these industries were using conventional methods for manufacture of glass and ceramics. Due to technological upgradation, new machines have been introduced in these industries. The operation and maintenance of these machines requires trained personnel in the respective fields. A diploma holder in ceramic and glass engineering is supposed to possess the adequate knowledge of raw material, manufacturing process, use of decorative designs and colour along with operation and maintenance of machines and tools used in these industries.

There is present and projected job potential in the field of glass and ceramics. The industry can no doubt flourish if diploma holders in glass and ceramic engineering are put to jobs in place of conventional untrained personnel engaged in the industries of this field.

PROFILE DEVELOPMENT

The following procedure has been adopted in the revision of curriculum for diploma course in ceramic and glass engineering.

1. Personal contacts have been made with the industry people to assess job potential job activities and man power required in these industries.
 2. Activities have been analysed in the workshop by mutual interaction between experts from higher institutions, industry people and teachers of the polytechnic.
 3. Course objectives have been decided by activity analysis.
 4. Subjects of study and skill to be developed has been derived from course objectives.
 5. Horizontal and vertical organisation of subjects was carried out.
 6. Study and evaluation scheme was prepared.
 7. Detailed course contents were finalised in a workshop by mutual interaction among experts of the related field.
 8. List of equipments, space and staff required for implementing the curriculum was finalised by experts.
- It is hoped that this curriculum will be implemented in the right spirit for training competent diploma holders in ceramic and glass engineering.

Rationale

Drawing, which is known as the language of engineers, is a widely used means of communication among the designers, engineers, technicians, draftmen and craftsmen in the industry. The translation of ideas into practice without the use of this graphic language is really beyond imagination. Thus, for the effective and efficient communication among all those involved in an industrial system, it becomes necessary that the perosnnel working in different capacities acquire appropriate skills in the use of this graphic language in varying degrees of proficiency in accordance with their job requirements.

Generally speaking, an engineering technician working at the middle level of the threetier technical manpower spectrum, is required to read and interpret the designs and drawings, provided to him by technologists and subsequently to translate them to the craftsmen for actual execution of the job.

This course in Engineering Drawing has been designed, keeping in view, the above refered job functions of a technician in the industry. This preliminary course aims at building a foundation for the further courses in drawing and other allied subjects. The contents of the course have been selected as to form a core for the various deversified fields of engineering. It is expected that at the end of this session, the students acquires sufficient skill drafting and some ability in spetial visualization of simple objects.

The project report will include selection of site, market survey, list of equipments & machinery, raw materials, power, human resources, and investment involved. These things be rationally determined by the basis of actual data collected during survey. They are expected to visit existing industry for the purpose.

The project will also clearly mention amount of raw material wanted for 3 months working and yearly turn over and expected profit.

Prepare at least a few samples of the product, intended for manufacture, at institute level for producing before the examiner.

The project should have a table of the results of test and quality control of the product.

There should be a brief consideration of environment pollution due to this unit and measures to achieve & maintain the minimum permissible level of pollution.

The project will be evaluated by an external examiner for 120 marks whose breakup is as follows:
